

### Soil with organic matter

Because many stems have been cut and the remaining crop is mown and maybe even removed from the plot, you can practically call it robbery that takes place on the soil every year. This can be corrected through a so-called custom compost mixture. This mixture is determined by the SoilBalanceAnalysis. Based on the occupation of cations on the soil complex. The compost can also be used as an organic potassium gift, for example for the potassium gift in the growing season. But only after the crop is mown.

Elements that are too low in the soil, including for example trace elements, can be added to the custom compost mixture. Compost is perfectly capable to bind positive and negative elements to itself. In addition to clay, because clay can only bind positive elements to itself. The compost can simply be applied on top of the ground.

#### Roadmap compost:

1. Take a soil sample
2. Fill in a form
3. Have a SoilBalanceAnalysis made
4. Request a custom compost mixture

Extensive product information about the compost products and the videos about the application of compost can be found in the KaRo [webshop](#).
